

Reclaim.ai is an AI-powered smart calendar and time-management assistant designed for platforms like Google Calendar and Outlook. Rather than forcing you to map out every single minute manually, Reclaim uses automation and smart agents to dynamically schedule tasks, meetings, personal habits, and decompression breaks around your evolving workday.

Core Product Features

Reclaim breaks away from static digital calendars by introducing flexible, rule-based blocks. Its core features include:

- **AI Focus Time:** Automatically blocks off chunks of time for deep, uninterrupted work based on your ideal preferences, shifting them dynamically if urgent meetings pop up.
- **AI Habits:** Schedules recurring personal or professional routines (like "Review Emails," "Lunch," or "Gym"). You set a time window and frequency, and the AI finds the best slot every day.
- **AI Tasks:** Integrates your to-do lists directly into the calendar. Instead of just a checklist, tasks are assigned actual time blocks based on due dates and priority levels.
- **Smart Meetings & Scheduling Links:** Goes beyond standard booking tools (like Calendly) by evaluating the true availability of all attendees. It automatically uncovers the optimal time for internal group syncs or external one-on-ones.
- **Calendar Sync:** Seamlessly mirrors events between multiple calendars (e.g., syncing your personal calendar to your work calendar) while masking sensitive details, preventing colleagues from booking over your personal commitments.
- **Buffer & Travel Time:** Automatically injects customizable breaks or travel time before and after meetings to avoid back-to-back fatigue.
- **Time Tracking & Workforce Analytics:** Compiles detailed breakdowns of how your hours are spent across internal meetings, deep work, and administrative tasks, offering actionable insights into work-life balance and productivity.

UI Structure and User Experience

Reclaim's interface emphasizes a highly visual, data-informed layout that sits alongside or sits natively within your primary calendar view.

The software relies on a modern, modular design broken down into several core UI zones:

1. Left-Hand Collapsible Sidebar

The primary navigation hub anchors the app's structural layout. It utilizes a clean, icon-based sidebar allowing you to instantly jump between:

- **Planner:** The primary view combining your day-to-day calendar with a sidebar for upcoming tasks and habits.
- **Habits / Tasks:** Dedicated management screens where you can create new smart routines and input project line-items with their respective durations and deadlines.
- **Scheduling Links:** A dashboard to customize, share, and track your smart meeting parameters.
- **Analytics / Stats:** A comprehensive visualization suite utilizing clean bar graphs, donut charts, and trend lines to map out your weekly time distribution (as shown in the analytical view above).

2. The Smart Calendar Canvas

The central layout displays your schedule in standard daily or weekly spreads. The key UI innovation here is **color-coded visual states**. Items scheduled by Reclaim appear in a translucent or "Free" state to indicate flexibility. As your day fills up and deadlines approach, the UI shifts these blocks into a solid, locked "Busy" state, defending that time from external bookings.

3. Contextual Control Panels & Sidebar Trays

When clicking an item or adding a task, a streamlined drawer slides out from the right side of the UI. This eliminates full-screen context switching. From this menu, users can adjust a task's priority, toggle a habit between "Solo" or "Team," or immediately instruct the AI agent to

"Reschedule" or "Lock" a specific block.
